Unhealthy Weight Management Practices Associated with Non-Medical Use of Prescription Drugs Among Adolescents

Study in the American Journal of Preventive Medicine reinforces the need for comprehensive health education efforts addressing healthy weight management strategies and substance abuse education.

Ann Arbor, MI, November 15, 2016 – Non-medical use of prescription drugs (NMUPD) is a serious public health concern in the U.S. Investigators from the Centers for Disease Control and Prevention (CDC) and the U.S. Public Health Service Commissioned Corps have identified significant associations between the non-medical use of prescription drugs and unhealthy weight management practices. They suggest that health educators in the school setting, as well as other health professionals who provide services to adolescents, should focus on healthy weight management strategies and other substance-specific messages. Their findings are published in the American Journal of Preventive Medicine.

About 17% of U.S. students in grades 9–12 have engaged in NMUPD according to the latest Youth Risk Behavior Survey, a nationally representative cross-sectional survey published by the CDC. Reasons include pain relief, getting high, improving concentration, and weight loss. This study is the first to investigate the association between NMUPD and unhealthy weight management practices (UWMP) among high school students using nationally representative data.

“Nearly 1 in 5 high school students say they’ve used prescription drugs without a prescription – so it’s important to understand other behaviors associated with this drug use to better target interventions for young people,” said lead investigator Heather B. Clayton, PhD, MPH, of CDC’s Division of Adolescent and School Health. “NMUPD for weight loss is of particular concern as it and other unhealthy weight management practices – such as fasting, vomiting, and using diet pills or laxatives – can all have adverse health and behavioral outcomes.”

Investigators combined data from the 2011 and 2013 cycles of the Youth Risk Behavior Survey. They restricted the analytic sample to students who reported a weight loss goal of either staying the same weight or losing weight, resulting in a sample of 7,482 male and 10,941 female students.

The study assessed UWMP by asking participants whether they had gone without eating for 24 hours or more; taken any diet pills, powders or liquids without a doctor’s advice; or vomited or used laxatives during the previous 30 days in order to lose weight or keep from gaining weight. NMUPD was assessed by asking participants how many times in their life they had taken a prescription drug (such as OxyContin,
Percocet, Vicodin, Codeine, Adderall, Ritalin, or Xanax) without a doctor’s prescription. The data were analyzed in 2016.

Female students were more likely to engage in unhealthy weight management practices than male students, with twice as many females engaging in fasting and vomiting/laxative use and taking diet pills/powders/liquids. All unhealthy weight management practices were significantly associated with NMUPD in female students.

Among male students, there were significant associations between NMUPD and two of the three UWMPs: fasting and vomiting or taking laxatives.

While the study examines the non-medical use of prescription drugs in general, findings were consistent with previous studies that explored UWMPs and non-medical prescription stimulant use in adult populations.

“One explanation for the association between UWMPs and NMUPD is that both behaviors reflect a constellation of adolescent health risks,” Clayton said. “These behaviors may be attributed to stressors, which could be caused by a host of factors that affect adolescents.”

“All parents should educate their children about the dangers of nonmedical use of prescription drugs and make sure their children do not have easy access to these substances. Parents concerned that their child is engaging in substance-use behaviors or unhealthy weight management practices should immediately consult their health care provider. Health educators can consult the CDC’s Registries of Programs Effective in Reducing Youth Risk Behaviors (www.cdc.gov/healthyyouth/adolescenthealth registries.htm) for suggestions on substance abuse prevention,” she concluded.

ABOUT THE AMERICAN JOURNAL OF PREVENTIVE MEDICINE

The American Journal of Preventive Medicine (www.ajpmonline.org) is the official journal of The American College of Preventive Medicine (www.acpm.org) and the Association for Prevention Teaching and Research (http://www.aptrweb.org/). It publishes articles in the areas of prevention research, teaching, practice and policy. Original research is published on interventions aimed at the prevention of chronic and acute disease and the promotion of individual and community health. The journal features papers that address the primary and secondary prevention of important clinical, behavioral and public health issues such as injury and violence, infectious disease, women's health, smoking, sedentary behaviors and physical activity, nutrition, diabetes, obesity, and alcohol and drug abuse. Papers also address educational initiatives aimed at improving the ability of health professionals to provide effective clinical prevention and public health services. The journal also publishes official policy statements from the two co-sponsoring organizations, health services research pertinent to prevention and public health, review articles, media reviews, and editorials.
The *American Journal of Preventive Medicine*, with an Impact Factor of 4.465, is ranked 14th in Public, Environmental, and Occupational Health titles and 16th in General & Internal Medicine titles for total number of citations according to the *2015 Journal Citation Reports®* published by Thomson Reuters, 2016.

**ABOUT ELSEVIER**
Elsevier ([www.elsevier.com](http://www.elsevier.com)) is a world-leading provider of information solutions that enhance the performance of science, health, and technology professionals, empowering them to make better decisions, deliver better care, and sometimes make groundbreaking discoveries that advance the boundaries of knowledge and human progress. Elsevier provides web-based, digital solutions – among them ScienceDirect ([www.sciencedirect.com](http://www.sciencedirect.com)), Scopus ([www.scopus.com](http://www.scopus.com)), Elsevier Research Intelligence ([www.elsevier.com/research-intelligence](http://www.elsevier.com/research-intelligence)), and ClinicalKey ([www.clinicalkey.com](http://www.clinicalkey.com)) – and publishes over 2,500 journals, including *The Lancet* ([www.thelancet.com](http://www.thelancet.com)) and *Cell* ([www.cell.com](http://www.cell.com)), and more than 35,000 book titles, including a number of iconic reference works. Elsevier is part of RELX Group ([www.relx.com](http://www.relx.com)), a world-leading provider of information and analytics for professional and business customers across industries.
